# Chapter 2. Machine Instructions and Programs
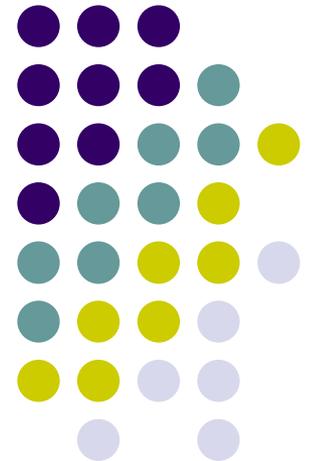

Objectives

- Machine instructions and program execution, including branching and subroutine call and return operations.

- Number representation and addition/subtraction in the 2's-complement system.

- Addressing methods for accessing register and memory operands.

- Assembly language for representing machine instructions, data, and programs.

- Program-controlled Input/Output operations.

Number, Arithmetic Operations, and Characters
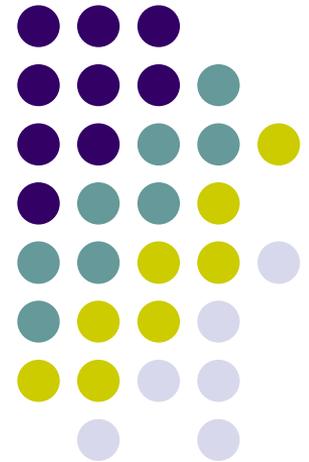

Signed Integer

- 3 major representations:

  Sign and magnitude

  One's complement

  Two's complement

- Assumptions:

  4-bit machine word

  16 different values can be represented

  Roughly half are positive, half are negative

Sign and Magnitude Representation
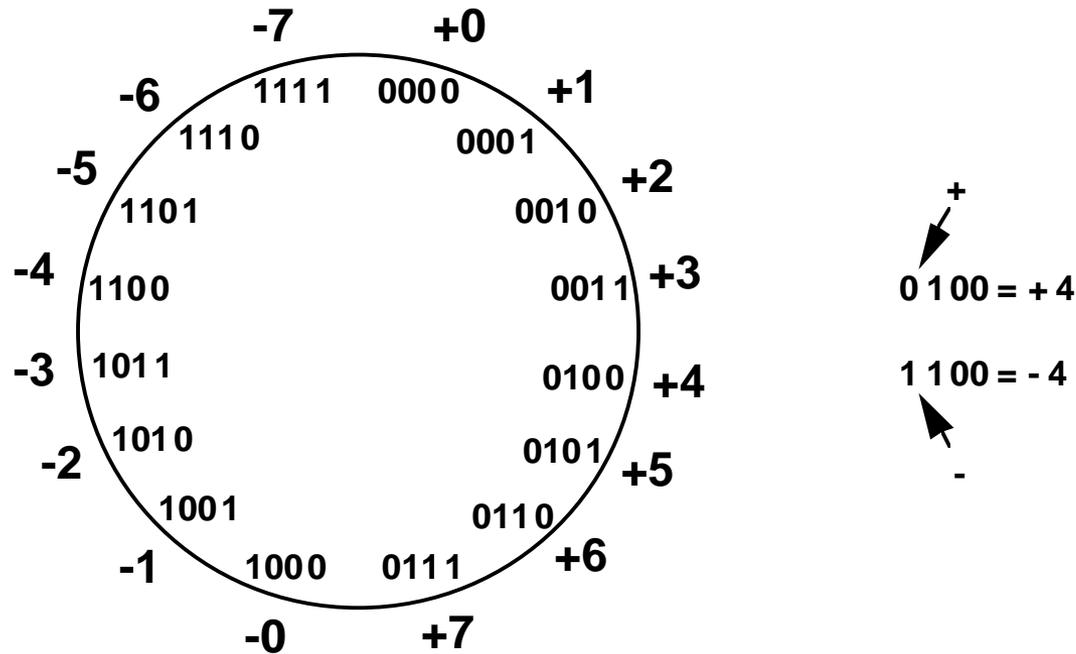

High order bit is sign: 0 = positive (or zero), 1 = negative
Three low order bits is the magnitude: 0 (000) thru 7 (111)
Number range for n bits = +/-2^{n-1} -1
Two representations for 0

One's Complement Representation

                        -0   +0
            -1   1111   0000   +1
                  1110   0001
         -2   +2
              1101   0010
                                                    +
         -3 1100   0011 +3
                                                  0 1 0 0 = + 4
         -4 1011   0100 +4
                                                  1 0 1 1 = - 4
         -5   1010   0101   +5
                  1001   0110   -
            -6   1000   0111   +6
   -7   +7
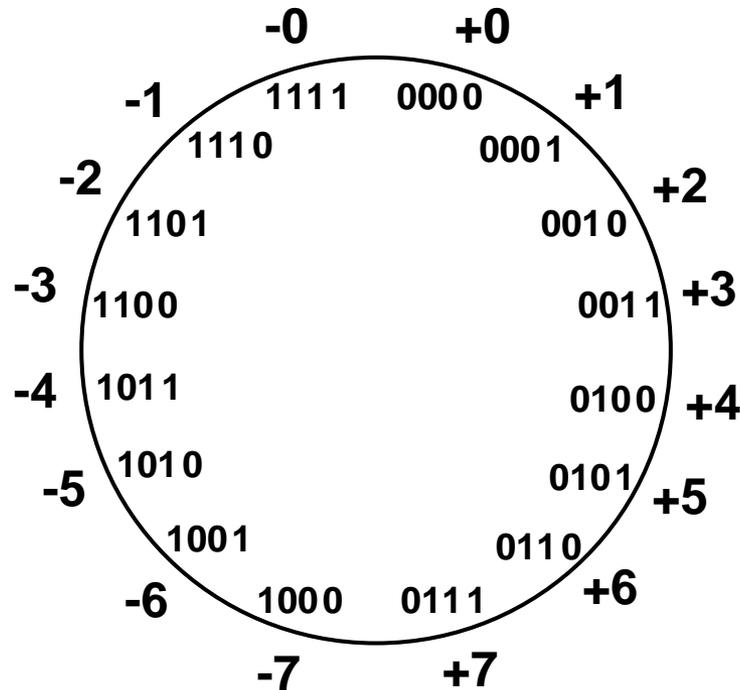

- Subtraction implemented by addition & 1's complement
- Still two representations of 0! This causes some problems
- Some complexities in addition

Two's Complement Representation

like 1's comp except shifted one position clockwise

-1 **+0**

-2 1111 0000 **+1**

1110 0001

-3

1101 0010 **+2**

-4 1100 0011 **+3**

-5 1011 0100 **+4**

1010 0101

-6 1001 0110 **+5**

-7 1000 0111 **+6**

-8 **+7**

+
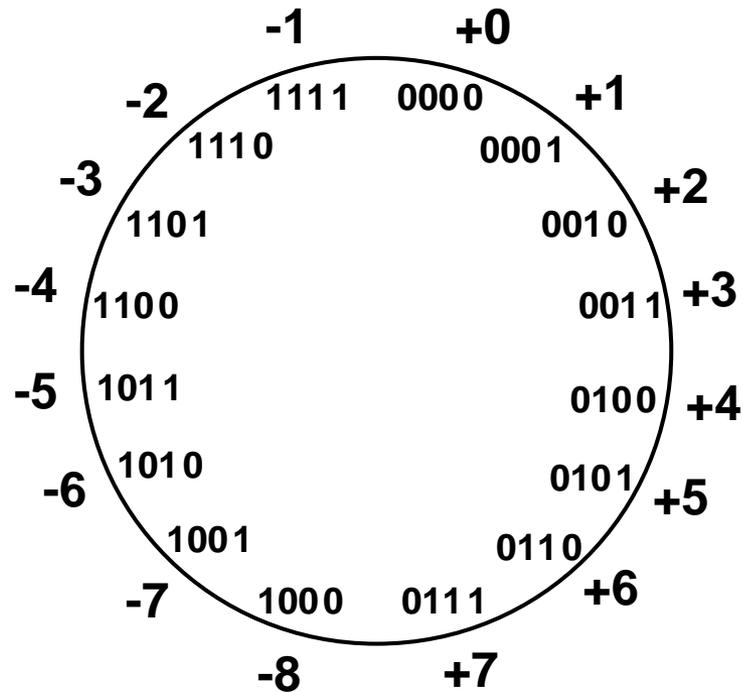

0 1 0 0 = + 4

1 1 0 0 = - 4

-

- Only one representation for 0
- One more negative number than positive number

Binary, Signed-Integer Representations

B	Values represented		
$b_3 b_2 b_1 b_0$	Sign and magnitude	1's complement	2's complement
0 1 1 1	+ 7	+ 7	+ 7
0 1 1 0	+ 6	+ 6	+ 6
0 1 0 1	+ 5	+ 5	+ 5
0 1 0 0	+ 4	+ 4	+ 4
0 0 1 1	+ 3	+ 3	+ 3
0 0 1 0	+ 2	+ 2	+ 2
0 0 0 1	+ 1	+ 1	+ 1
0 0 0 0	+ 0	+ 0	+ 0
1 0 0 0	- 0	- 7	- 8
1 0 0 1	- 1	- 6	- 7
1 0 1 0	- 2	- 5	- 6
1 0 1 1	- 3	- 4	- 5
1 1 0 0	- 4	- 3	- 4
1 1 0 1	- 5	- 2	- 3
1 1 1 0	- 6	- 1	- 2
1 1 1 1	- 7	- 0	- 1

Figure 2.1. Binary, signed-integer representations.

Addition and Subtraction – 2's Complement

4	0100	-4	1100
+ 3	0011	+ (-3)	1101
7	0111	-7	11001

If carry-in to the high order bit = carry-out then ignore carry

if carry-in differs from carry-out then overflow

4	0100	-4	1100
- 3	1101	+ 3	0011
1	10001	-1	1111

Simpler addition scheme makes twos complement the most common choice for integer number systems within digital systems

2's-Complement Add and Subtract Operations

(a)
```
    0 0 1 0      (+2)
  + 0 0 1 1      (+3)
    0 1 0 1      (+5)
```

(b)
```
    0 1 0 0      (+4)
  + 1 0 1 0      (- 6)
    1 1 1 0      (- 2)
```

(c)
```
    1 0 1 1      (- 5)
  + 1 1 1 0      (- 2)
    1 0 0 1      (- 7)
```

(d)
```
    0 1 1 1      (+7)
  + 1 1 0 1      (- 3)
    0 1 0 0      (+4)
```

(e)
```
    1 1 0 1      (- 3)
  - 1 0 0 1      (- 7)
```
⟹
```
    1 1 0 1
  + 0 1 1 1
    0 1 0 0      (+4)
```

(f)
```
    0 0 1 0      (+2)

```

(i)
```
    1 0 0 1      (- 7)
  - 0 0 0 1      (+1)
```
⟹
```
    1 0 0 1
  + 1 1 1 1
    1 0 0 0      (- 8)
```

(j)
```
    0 0 1 0      (+2)
  - 1 1 0 1      (- 3)
```
⟹
```
    0 0 1 0
  + 0 0 1 1
    0 1 0 1      (+ 5)
```

Figure 2.4. 2's-complement Add and Subtract operations.

Overflow - Add two positive numbers to get a negative number or two negative numbers to get a positive number

-1 +0
-2 1111 0000 +1
1110 0001
-3 0010 +2
1101
-4 1100 0011 +3
-5 1011 0100 +4
-6 1010 0101 +5
1001 0110
-7 1000 0111 +6
-8 +7

5 + 3 = -8

-1 +0
-2 1111 0000 +1
1110 0001
-3 0010 +2
1101
-4 1100 0011 +3
-5 1011 0100 +4
-6 1010 0101 +5
1001 0110
-7 1000 0111 +6
-8 +7

-7 - 2 = +7
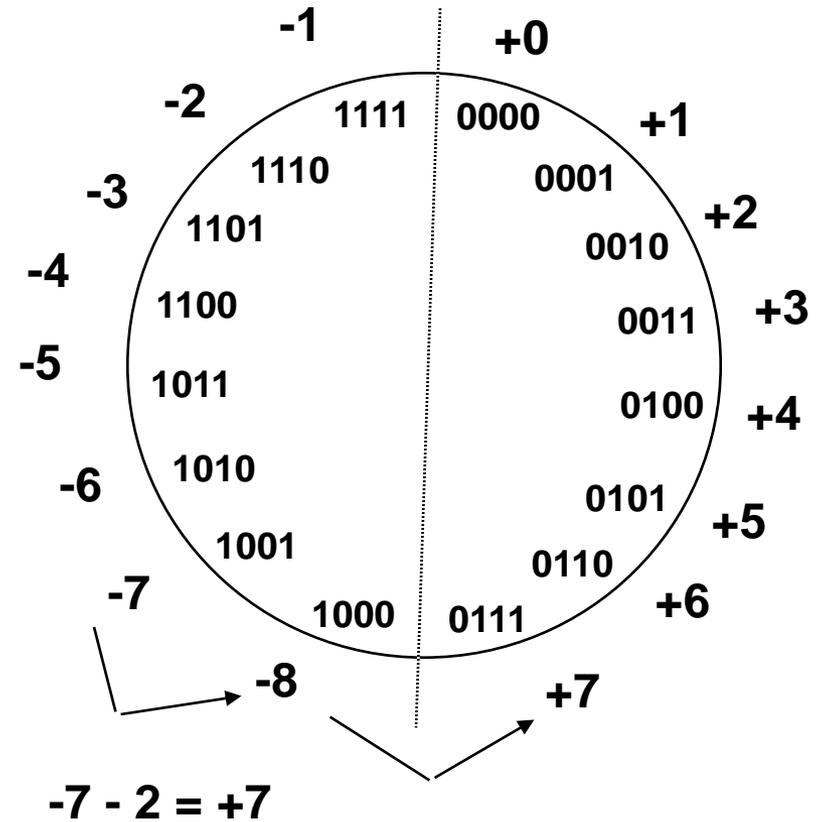

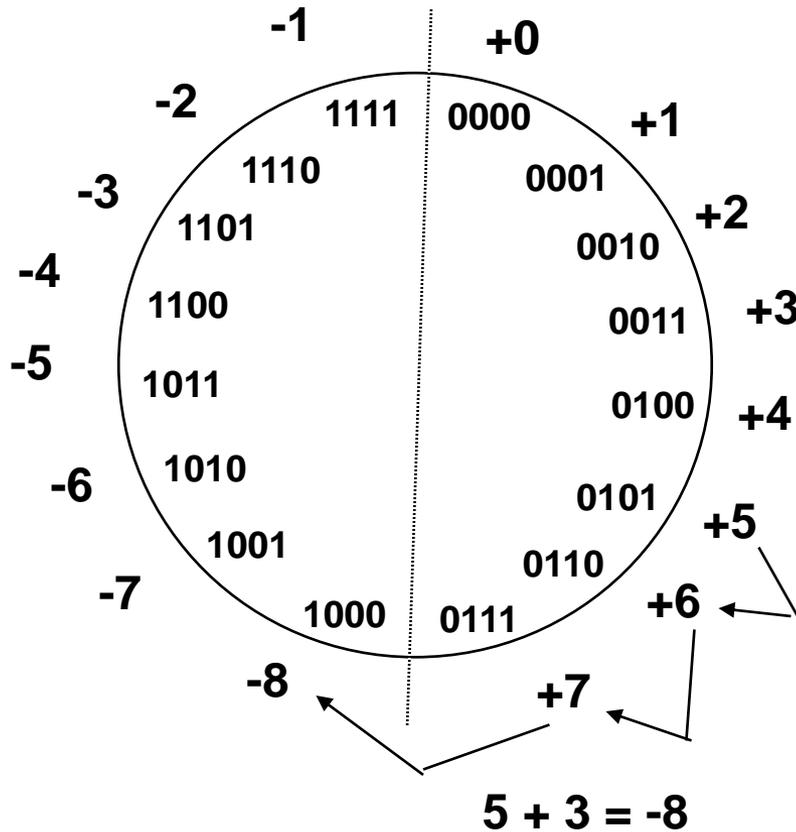

Overflow Conditions

5   0 1 1 1
         0 1 0 1

_3_   _0 0 1 1_

-8   1 0 0 0

Overflow

5   0 0 0 0
         0 1 0 1

_2_   _0 0 1 0_

7   0 1 1 1

No overflow

-7   1 0 0 0
         1 0 0 1

_-2_   _1 1 0 0_

7   1 0 1 1 1

Overflow

-3   1 1 1 1
         1 1 0 1

_-5_   _1 0 1 1_

-8   1 1 0 0 0

No overflow

Overflow when carry-in to the high-order bit does not equal carry out

Sign Extension

- Task:
  - Given w-bit signed integer x
  - Convert it to $w+k$-bit integer with same value
- Rule:
  - Make k copies of sign bit:
  - $X' = x_{w-1}, \ldots, x_{w-1}, x_{w-1}, x_{w-2}, \ldots, x_0$

k copies of MSB
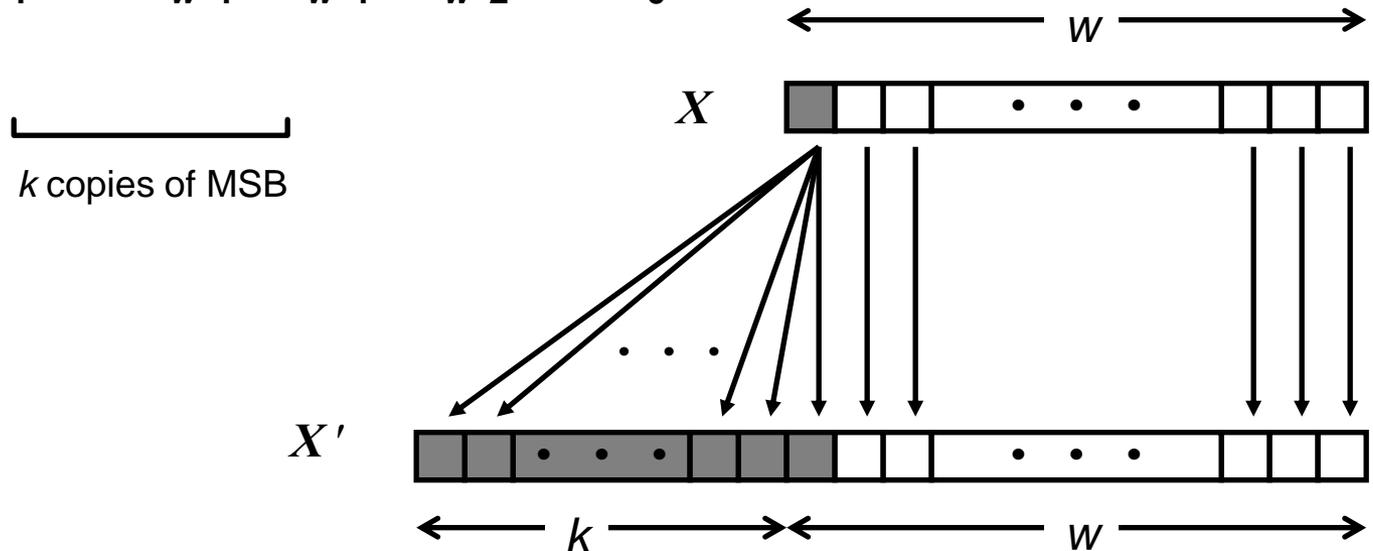

Sign Extension Example

```
short int x =  15213;
int       ix = (int) x;
short int y = -15213;
int       iy = (int) y;
```

	Decimal	Hex	Binary
x	15213	3B 6D	00111011 01101101
ix	15213	00 00 C4 92	00000000 00000000 00111011 01101101
y	-15213	C4 93	11000100 10010011
iy	-15213	FF FF C4 93	11111111 11111111 11000100 10010011

Memory Locations, Addresses, and Operations
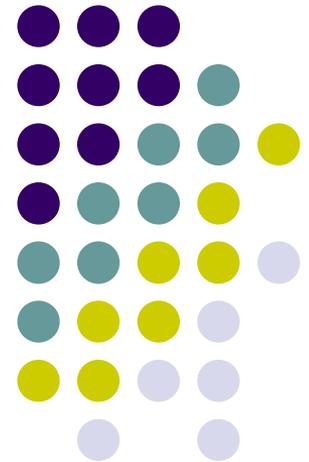

Memory Location, Addresses, and Operation

- Memory consists of many millions of storage cells, each of which can store 1 bit.

- Data is usually accessed in n-bit groups. n is called word length.

n bits

first word

second word

i th word

last word
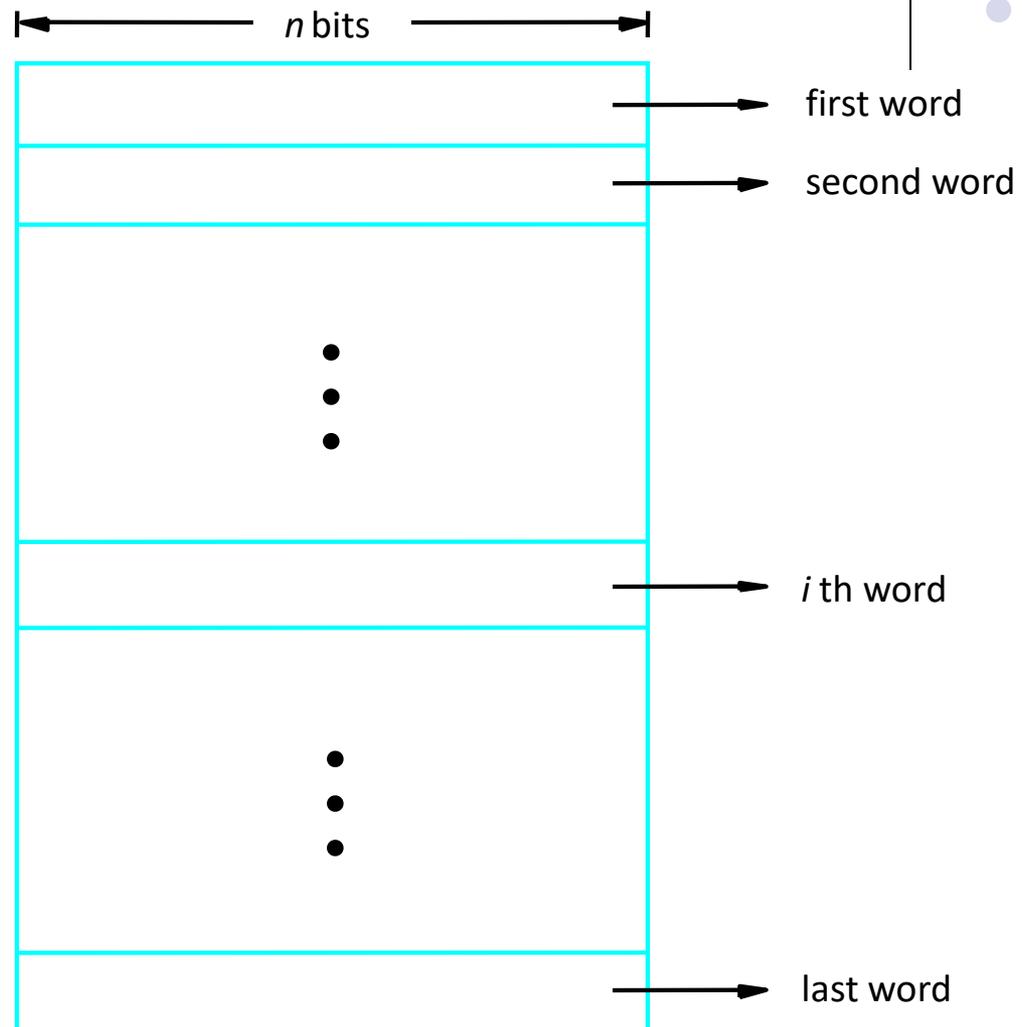

Figure 2.5.   Memory words.

Memory Location, Addresses, and Operation

- ## 32-bit word length example

32 bits

b_{31} | b_{30} | • • • | b_1 | b_0
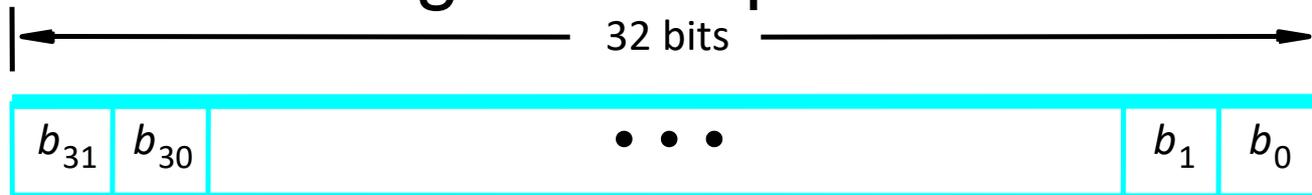

Sign bit: b_{31} = 0 for positive numbers
b_{31} = 1 for negative numbers

(a) A signed integer

| 8 bits | 8 bits | 8 bits | 8 bits |

ASCII character | ASCII character | ASCII character | ASCII character
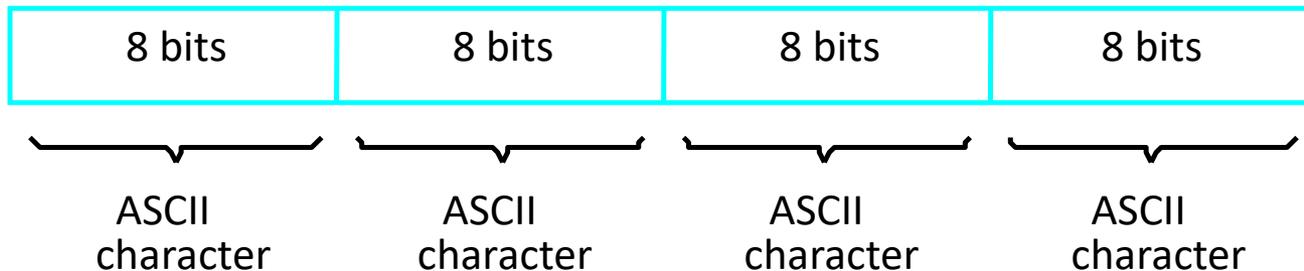

(b) Four characters

Memory Location, Addresses, and Operation

- To retrieve information from memory, either for one word or one byte (8-bit), addresses for each location are needed.

- A k-bit address memory has 2^k memory locations, namely $0 - 2^k$-1, called memory space.

- 24-bit memory: $2^{24} = 16,777,216 = 16M$ ($1M=2^{20}$)

- 32-bit memory: $2^{32} = 4G$ ($1G=2^{30}$)

- 1K(kilo)=2^{10}

- 1T(tera)=2^{40}

Memory Location, Addresses, and Operation

- It is impractical to assign distinct addresses to individual bit locations in the memory.

- The most practical assignment is to have successive addresses refer to successive byte locations in the memory – byte-addressable memory.

- Byte locations have addresses 0, 1, 2, … If word length is 32 bits, they successive words are located at addresses 0, 4, 8,…

Big-Endian and Little-Endian Assignments

Big-Endian: lower byte addresses are used for the most significant bytes of the word

Little-Endian: opposite ordering. lower byte addresses are used for the less significant bytes of the word

Word address	Byte address			
0	0	1	2	3
4	4	5	6	7
⋮	⋮			
$2^k - 4$	$2^k - 4$	$2^k - 3$	$2^k - 2$	$2^k - 1$

(a) Big-endian assignment

Word address	Byte address			
0	3	2	1	0
4	7	6	5	4
⋮	⋮			
$2^k - 4$	$2^k - 1$	$2^k - 2$	$2^k - 3$	$2^k - 4$
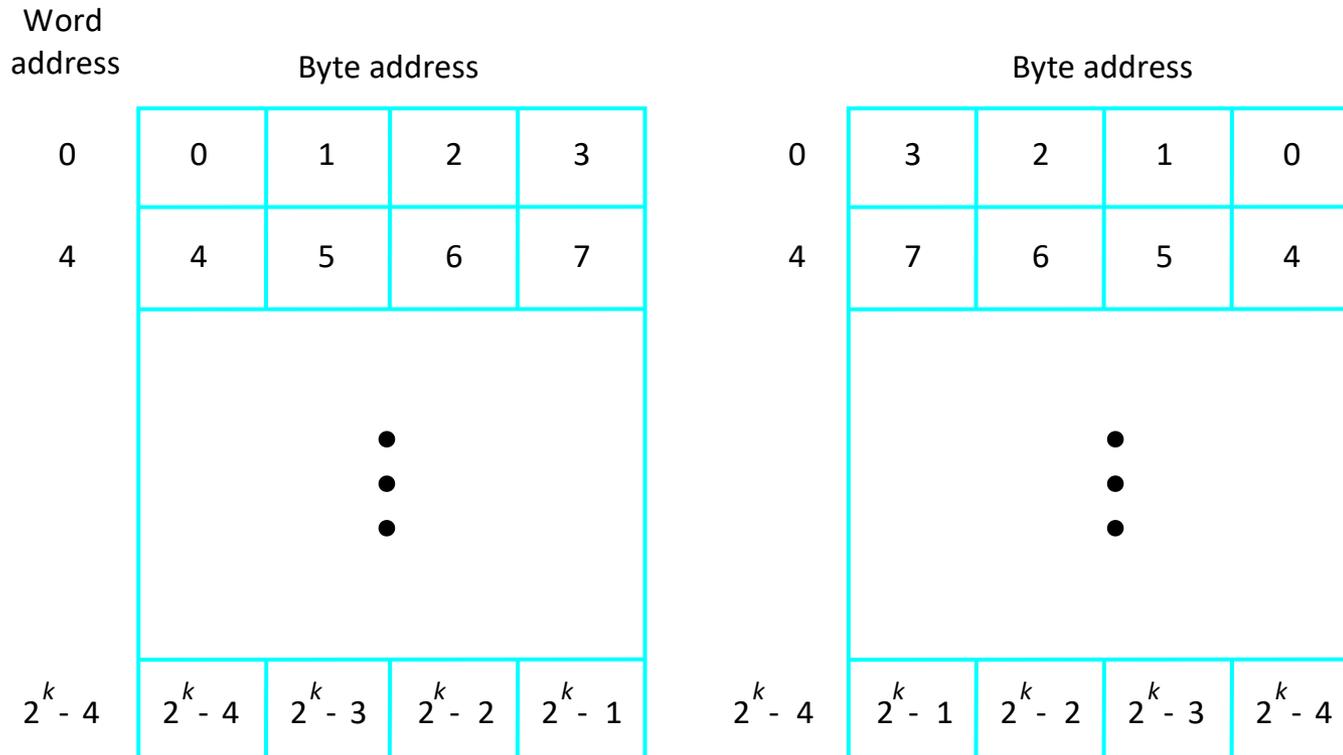

(b) Little-endian assignment

Figure 2.7. Byte and word addressing.

# Memory Location, Addresses, and Operation

- Address ordering of bytes
- Word alignment
  - Words are said to be aligned in memory if they begin at a byte addr. that is a multiple of the num of bytes in a word.
    - 16-bit word: word addresses: 0, 2, 4,….
    - 32-bit word: word addresses: 0, 4, 8,….
    - 64-bit word: word addresses: 0, 8,16,….
- Access numbers, characters, and character strings

Memory Operation

- Load (or Read or Fetch)
  - Copy the content. The memory content doesn't change.
  - Address – Load
  - Registers can be used
- Store (or Write)
  - Overwrite the content in memory
  - Address and Data – Store
  - Registers can be used

Instruction and Instruction Sequencing
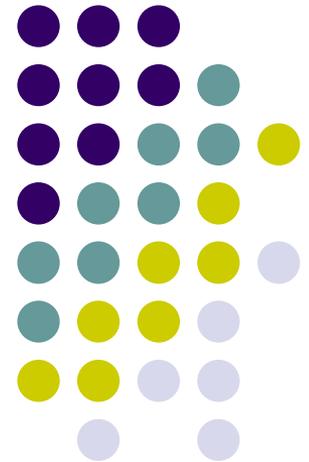

"Must-Perform" Operations

- Data transfers between the memory and the processor registers

- Arithmetic and logic operations on data

- Program sequencing and control

- I/O transfers

Register Transfer Notation

- Identify a location by a symbolic name standing for its hardware binary address (LOC, R0,…)

- Contents of a location are denoted by placing square brackets around the name of the location (R1←[LOC], R3 ←[R1]+[R2])

- Register Transfer Notation (RTN)

Assembly Language Notation

- Represent machine instructions and programs.

- Move LOC, R1 = R1←[LOC]

- Add R1, R2, R3 = R3 ←[R1]+[R2]

CPU Organization

- Single Accumulator
  - Result usually goes to the Accumulator
  - Accumulator has to be saved to memory quite often
- General Register
  - Registers hold operands thus reduce memory traffic
  - Register bookkeeping
- Stack
  - Operands and result are always in the stack

Instruction Formats

- ## Three-Address Instructions
  - ADD   R1, R2, R3   R1 ← R2 + R3
- ## Two-Address Instructions
  - ADD   R1, R2   R1 ← R1 + R2
- ## One-Address Instructions
  - ADD   M   AC ← AC + M[AR]
- ## Zero-Address Instructions
  - ADD   TOS ← TOS + (TOS – 1)
- ## RISC Instructions
  - Lots of registers. Memory is restricted to Load & Store

Instruction

| Opcode | Operand(s) or Address(es) |

Instruction Formats

Example: Evaluate (A+B) $*$ (C+D)

- Three-Address

  1. ADD   R1, A, B   ; R1 ← M[A] + M[B]
  2. ADD   R2, C, D   ; R2 ← M[C] + M[D]
  3. MUL   X, R1, R2   ; M[X] ← R1 $*$ R2

Instruction Formats

Example: Evaluate (A+B) $*$ (C+D)

- Two-Address
  1. MOV   R1, A   ; R1 ← M[A]
  2. ADD   R1, B   ; R1 ← R1 + M[B]
  3. MOV   R2, C   ; R2 ← M[C]
  4. ADD   R2, D   ; R2 ← R2 + M[D]
  5. MUL   R1, R2   ; R1 ← R1 $*$ R2
  6. MOV   X, R1   ; M[X] ← R1

Instruction Formats

Example: Evaluate (A+B) $*$ (C+D)

- One-Address

  1. LOAD   A   ; AC ← M[A]
  2. ADD   B   ; AC ← AC + M[B]
  3. STORE T   ; M[T] ← AC
  4. LOAD   C   ; AC ← M[C]
  5. ADD   D   ; AC ← AC + M[D]
  6. MUL   T   ; AC ← AC $*$ M[T]
  7. STORE X   ; M[X] ← AC

Instruction Formats

Example: Evaluate (A+B) $*$ (C+D)

- Zero-Address
  1. PUSH A   ; TOS $\leftarrow$ A
  2. PUSH B   ; TOS $\leftarrow$ B
  3. ADD   ; TOS $\leftarrow$ (A + B)
  4. PUSH C   ; TOS $\leftarrow$ C
  5. PUSH D   ; TOS $\leftarrow$ D
  6. ADD   ; TOS $\leftarrow$ (C + D)
  7. MUL   ; TOS $\leftarrow$ (C+D)$*$(A+B)
  8. POP   X   ; M[X] $\leftarrow$ TOS

Instruction Formats

Example: Evaluate (A+B) $*$ (C+D)

- RISC

1.	LOAD R1, A	; R1 ← M[A]
2.	LOAD R2, B	; R2 ← M[B]
3.	LOAD R3, C	; R3 ← M[C]
4.	LOAD R4, D	; R4 ← M[D]
5.	ADD R1, R1, R2	; R1 ← R1 + R2
6.	ADD R3, R3, R4	; R3 ← R3 + R4
7.	MUL R1, R1, R3	; R1 ← R1 $*$ R3
8.	STORE X, R1	; M[X] ← R1

Using Registers

- Registers are faster
- Shorter instructions
  - The number of registers is smaller (e.g. 32 registers need 5 bits)
- Potential speedup
- Minimize the frequency with which data is moved back and forth between the memory and processor registers.

Instruction Execution and Straight-Line Sequencing

Address	Contents	
Begin execution here → *i*	Move A,R0	⎱
i + 4	Add B,R0	3-instruction program segment
i + 8	Move R0,C	⎰
	⋮	
A		
	⋮	
B		Data for the program
	⋮	
C		
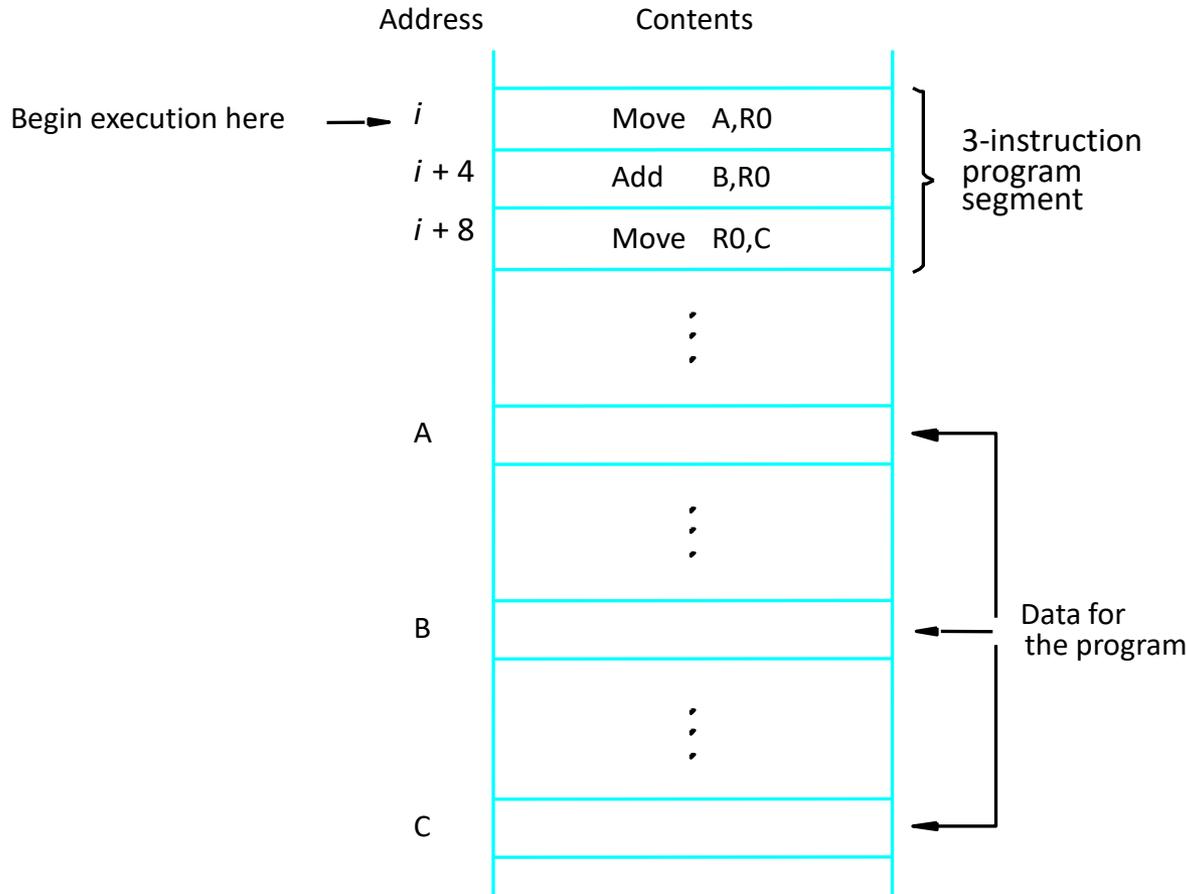

Assumptions:
- One memory operand per instruction
- 32-bit word length
- Memory is byte addressable
- Full memory address can be directly specified in a single-word instruction

Two-phase procedure
- Instruction fetch
- Instruction execute

Page 43

NUM *n*

Condition Codes

- Condition code flags
- Condition code register / status register
- N (negative)
- Z (zero)
- V (overflow)
- C (carry)
- Different instructions affect different flags

Conditional Branch Instructions

- Example:
  - A: 1 1 1 1 0 0 0 0
  - B: 0 0 0 1 0 1 0 0

A: 1 1 1 1 0 0 0 0

+(−B): 1 1 1 0 1 1 0 0

———————————————

1 1 0 1 1 1 0 0

C = 1   Z = 0

S = 1

V = 0

Status Bits

Addressing Modes
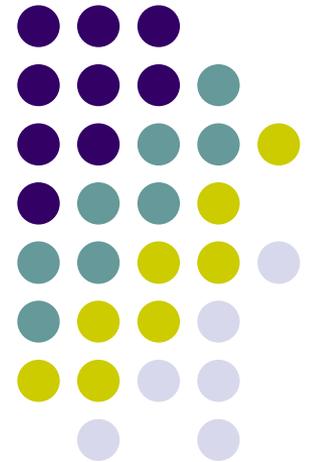

Generating Memory Addresses

- How to specify the address of branch target?

- Can we give the memory operand address directly in a single Add instruction in the loop?

- Use a register to hold the address of NUM1; then increment by 4 on each pass through the loop.

Addressing Modes

Instruction

| Opcode	Mode	...
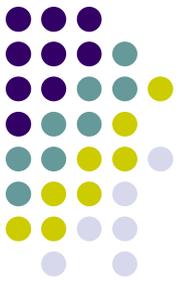

- Implied
  - AC is implied in "ADD   M[AR]" in "One-Address" instr.
  - TOS is implied in "ADD" in "Zero-Address" instr.
- Immediate
  - The use of a constant in "MOV   R1, 5", i.e. R1 ← 5
- Register
  - Indicate which register holds the operand
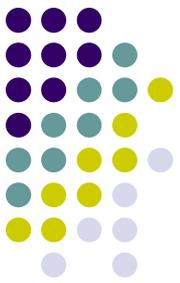

Addressing Modes

- Register Indirect
  - Indicate the register that holds the number of the register that holds the operand

    MOV   R1, (R2)

- Autoincrement / Autodecrement
  - Access & update in 1 instr.

- Direct Address
 - Use the given address to access a memory location

R1

R2 = 3

R3 = 5
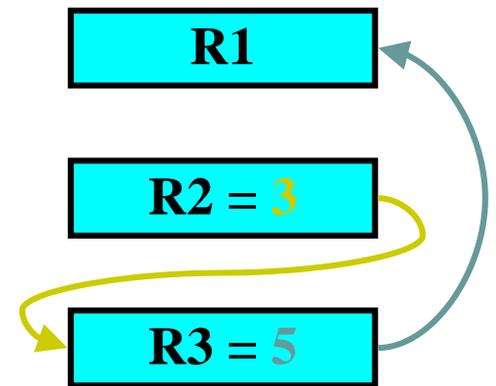

Addressing Modes

- Indirect Address
 - Indicate the memory location that holds the address of the memory location that holds the data

AR = 101

Memory

|	
100	
101	0 1 0 4
102	
103	
104	1 1 0 A
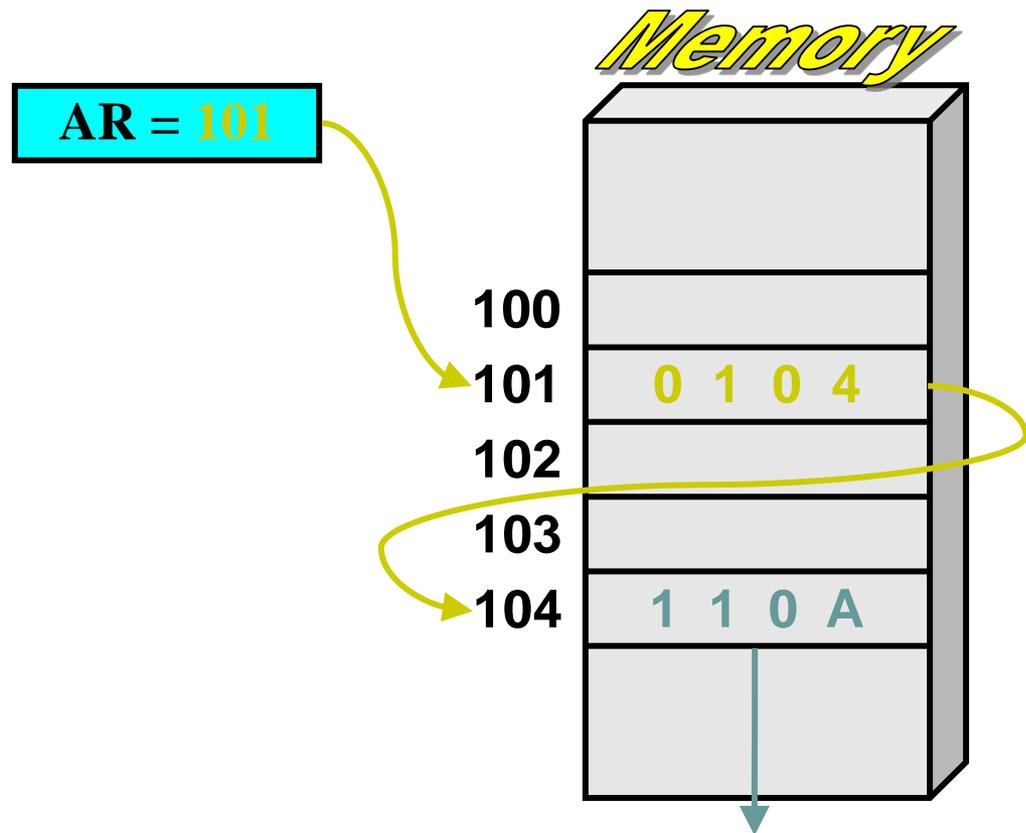

Addressing Modes

- ## Relative Address

  - *EA* = PC + Relative Addr

PC = 2	→ 2

+

AR = 100

Could be Positive or Negative
(2's Complement)

Memory

0	
1	
2	**Program**
100	**Data**
101	
102	1 1 0 A
103	
104	
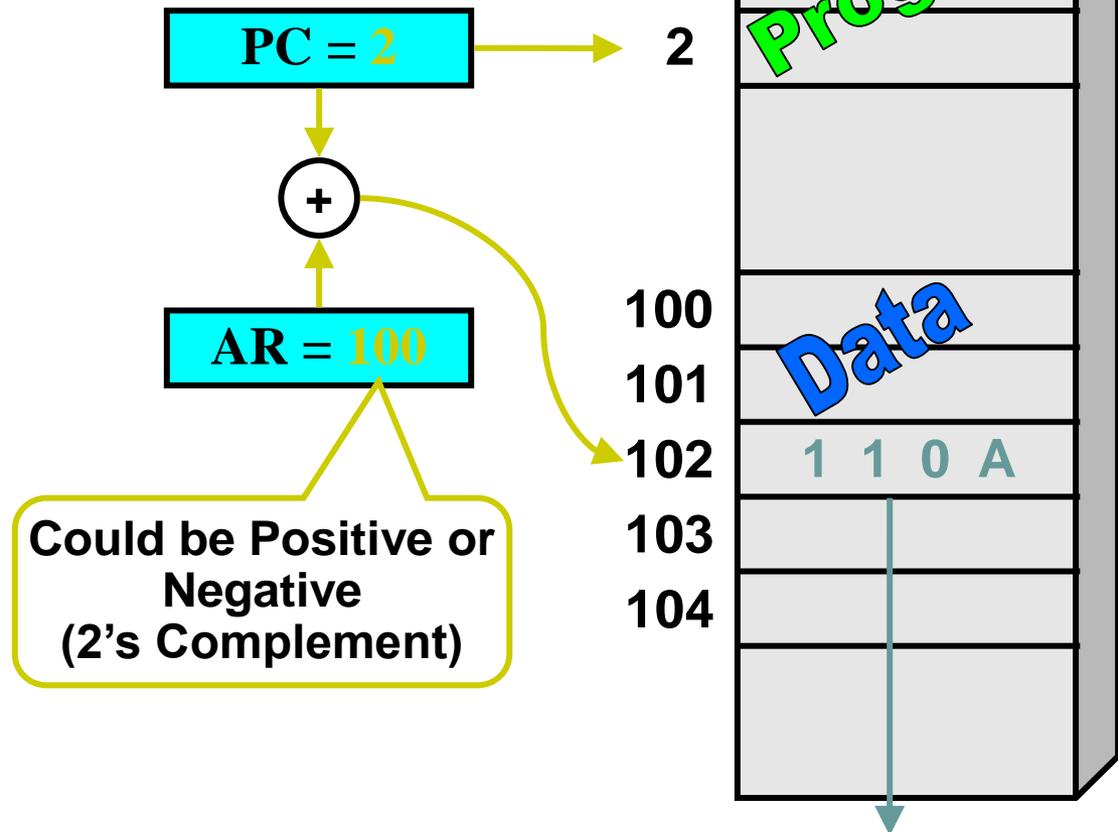

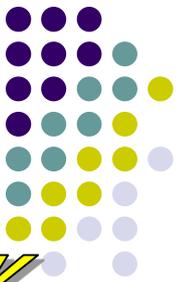

Addressing Modes

- ## Indexed

  - *EA* = Index Register + Relative Addr

Memory

Useful with "Autoincrement" or "Autodecrement"

XR = 2

+

AR = 100

Could be Positive or Negative (2's Complement)

100	
101	
102	**1 1 0 A**
103	
104	
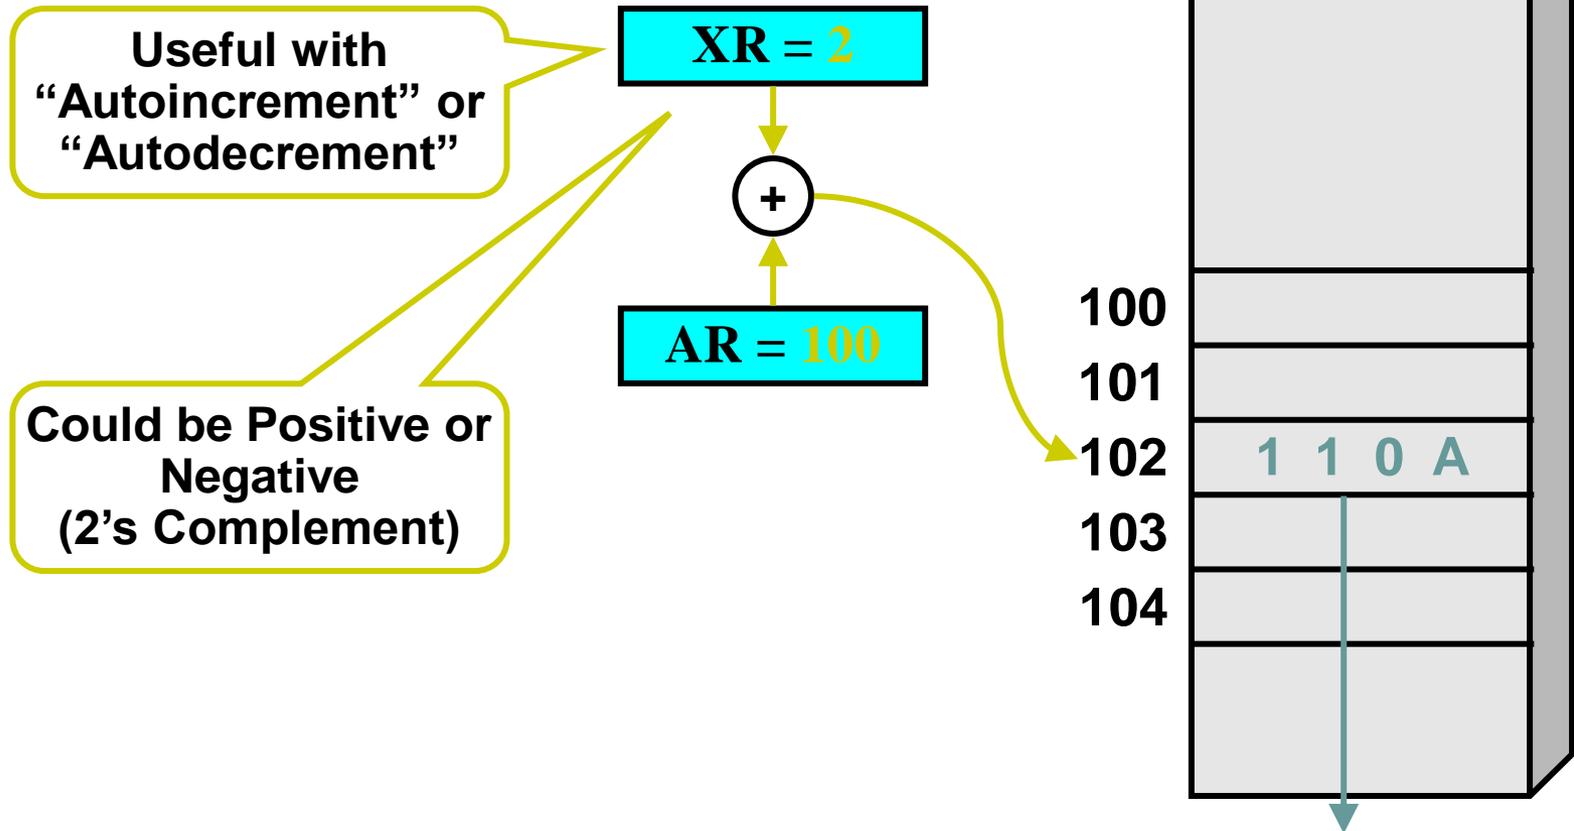

Addressing Modes

- Base Register
  - *EA* = Base Register + Relative Addr

Could be Positive or Negative (2's Complement)

AR = 2

+

BR = 100

Usually points to the beginning of an array

Memory

100	0 0 0 5
101	0 0 1 2
102	0 0 0 A
103	0 1 0 7
104	0 0 5 9

Addressing Modes
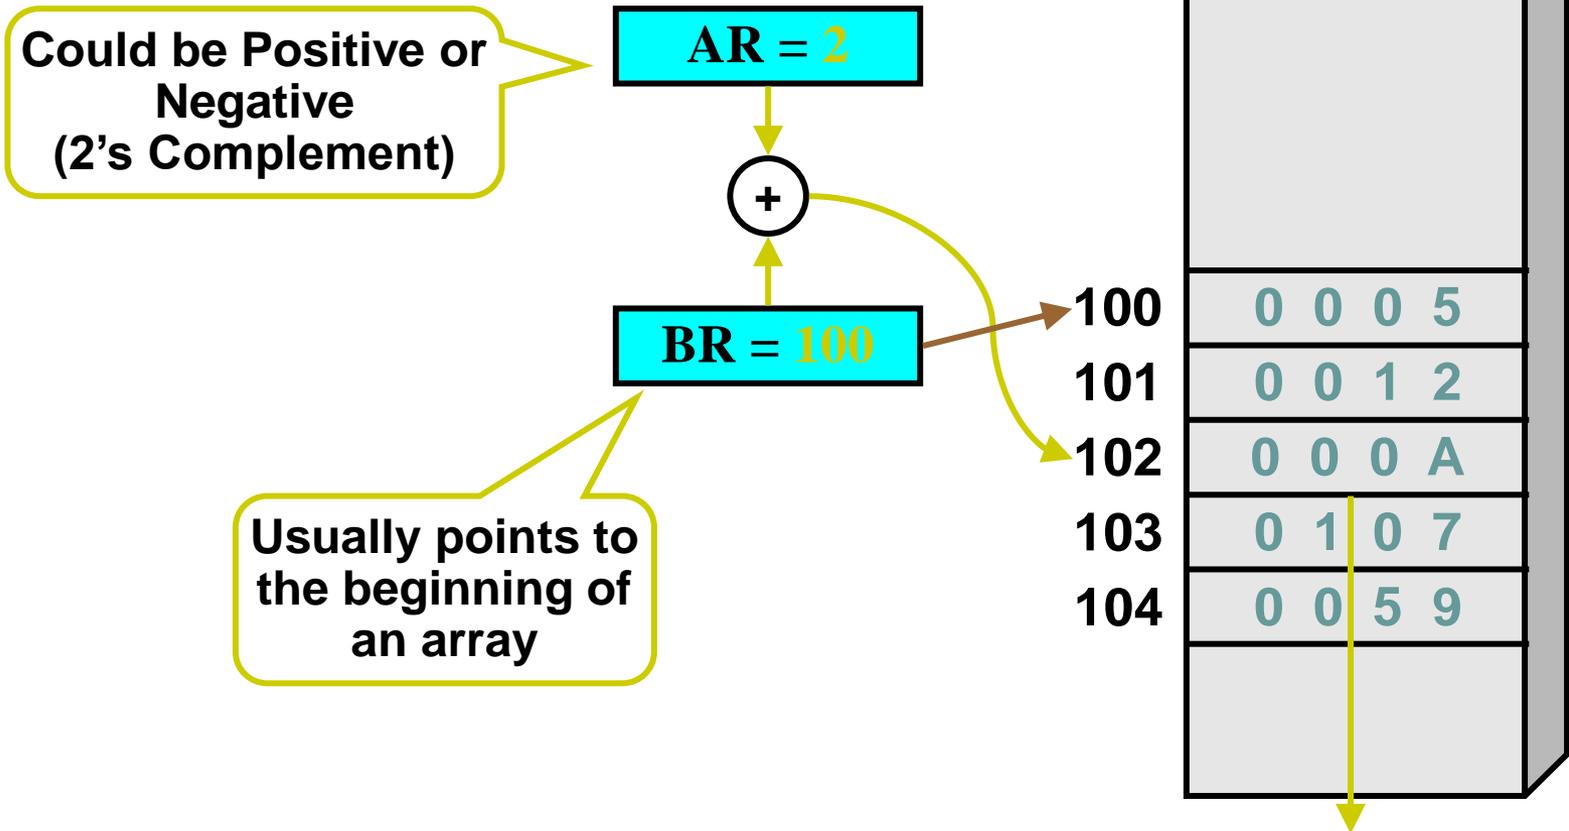

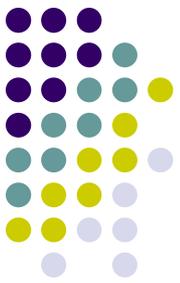

- The different ways in which the location of an operand is specified in an instruction are referred to as addressing modes.

Name	Assem bler syn tax	Addressing function
Immediate	#V alue	Op erand = Value
Register	R i	EA = R i
Absolute (Direct)	LOC	EA = LOC
Indirect	(R i) (LOC)	EA = [R i] EA = [LOC]
Index	X(R i)	EA = [R i] + X
Base with index	(R i ,R j)	EA = [R i] + [R j]
Base with index and offset	X(R i ,R j)	EA = [R i] + [R j] + X
Relative	X(PC)	EA = [PC] + X
Autoincremen t	(R i)+	EA = [R i] ; Incremen t R i
Autodecrement	$-$(R i)	Decremen t R i ; EA = [R i]

Indexing and Arrays

- Index mode – the effective address of the operand is generated by adding a constant value to the contents of a register.

- Index register

- $X(R_i)$: $EA = X + [R_i]$

- The constant X may be given either as an explicit number or as a symbolic name representing a numerical value.

- If X is shorter than a word, sign-extension is needed.

Indexing and Arrays

- In general, the Index mode facilitates access to an operand whose location is defined relative to a reference point within the data structure in which the operand appears.

- Several variations:
(R_i, R_j): EA = $[R_i]$ + $[R_j]$
$X(R_i, R_j)$: EA = X + $[R_i]$ + $[R_j]$

Relative Addressing

- Relative mode – the effective address is determined by the Index mode using the program counter in place of the general-purpose register.

- X(PC) – note that X is a signed number

- Branch>0   LOOP

- This location is computed by specifying it as an offset from the current value of PC.

- Branch target may be either before or after the branch instruction, the offset is given as a singed num.
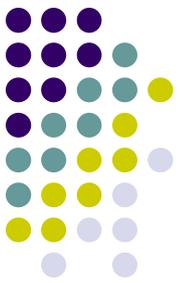

Additional Modes

- Autoincrement mode – the effective address of the operand is the contents of a register specified in the instruction. After accessing the operand, the contents of this register are automatically incremented to point to the next item in a list.

- $(R_i)+$. The increment is 1 for byte-sized operands, 2 for 16-bit operands, and 4 for 32-bit operands.

- Autodecrement mode: $-(R_i)$ – decrement first

```
            Move        N,R1
            Move        #NUM1,R2       Initialization
            Clear       R0
   LOOP     Add         (R2)+,R0
            Decrement   R1
            Branch>0    LOOP
            Move        R0,SUM
```
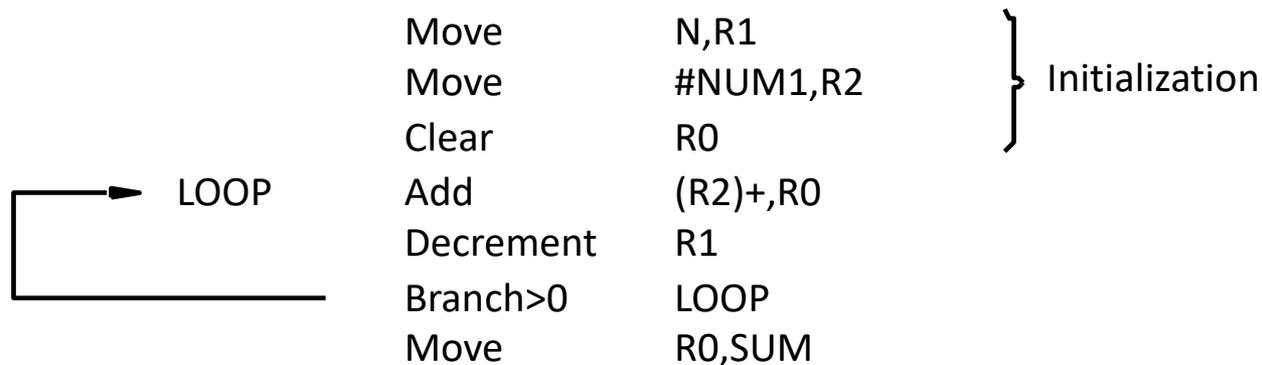

Figure 2.16. The Autoincrement addressing mode used in the program of Figure 2.12.

Assembly Language
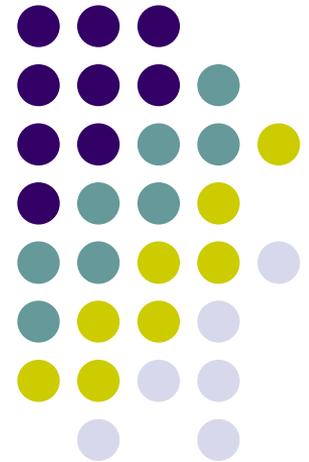

Types of Instructions

- Data Transfer Instructions

Name	Mnemonic
Load	LD
Store	ST
Move	MOV
Exchange	XCH
Input	IN
Output	OUT
Push	PUSH
Pop	POP

Data value is not modified

Data Transfer Instructions

Mode	Assembly	Register Transfer
Direct address	LD ADR	$AC \leftarrow M[ADR]$
Indirect address	LD @ADR	$AC \leftarrow M[M[ADR]]$
Relative address	LD $ADR	$AC \leftarrow M[PC+ADR]$
Immediate operand	LD #NBR	$AC \leftarrow NBR$
Index addressing	LD ADR(X)	$AC \leftarrow M[ADR+XR]$
Register	LD R1	$AC \leftarrow R1$
Register indirect	LD (R1)	$AC \leftarrow M[R1]$
Autoincrement	LD (R1)+	$AC \leftarrow M[R1], R1 \leftarrow R1+1$

Data Manipulation Instructions

- Arithmetic
- Logical & Bit Manipulation
- Shift

Name	Mnemonic
Increment	INC
Decrement	DEC
Add	ADD
Subtract	SUB
Multiply	MUL
Divide	DIV
Add with carry	ADDC
Subtract with borrow	SUBB
Negate	NEG

Name	Mnemonic
Clear	CLR
Complement	COM
AND	AND
OR	OR
Exclusive-OR	XOR
Clear carry	CLRC
Set carry	SETC
Complement carry	COMC
Enable interrupt	EI
Disable interrupt	DI

Name	Mnemonic
Logical shift right	SHR
Logical shift left	SHL
Arithmetic shift right	SHRA
Arithmetic shift left	SHLA
Rotate right	ROR
Rotate left	ROL
Rotate right through carry	RORC
Rotate left through carry	ROLC

Program Control Instructions

Name	Mnemonic
Branch	BR
Jump	JMP
Skip	SKP
Call	CALL
Return	RET
Compare (Subtract)	CMP
Test (AND)	TST

Subtract A – B but don't store the result

Mask

1 0 1 1 0 0 0 1

0 0 0 0 1 0 0 0

0 0 0 0 0 0 0 0
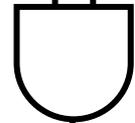

Conditional Branch Instructions

Mnemonic	Branch Condition	Tested Condition
BZ	Branch if zero	Z = 1
BNZ	Branch if not zero	Z = 0
BC	Branch if carry	C = 1
BNC	Branch if no carry	C = 0
BP	Branch if plus	S = 0
BM	Branch if minus	S = 1
BV	Branch if overflow	V = 1
BNV	Branch if no overflow	V = 0

Basic Input/Output Operations
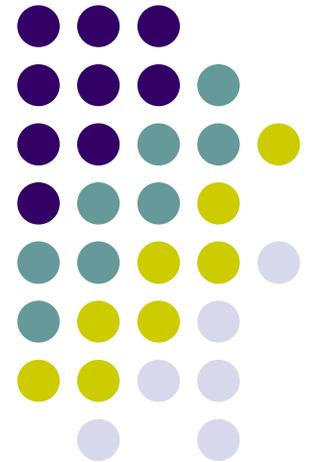

I/O

- The data on which the instructions operate are not necessarily already stored in memory.

- Data need to be transferred between processor and outside world (disk, keyboard, etc.)

- I/O operations are essential, the way they are performed can have a significant effect on the performance of the computer.

Program-Controlled I/O Example

- Read in character input from a keyboard and produce character output on a display screen.
  - Rate of data transfer (keyboard, display, processor)
  - Difference in speed between processor and I/O device creates the need for mechanisms to synchronize the transfer of data.
  - A solution: on output, the processor sends the first character and then waits for a signal from the display that the character has been received. It then sends the second character. Input is sent from the keyboard in a similar way.

Program-Controlled I/O Example

- Registers
- Flags
- Device interface

Program-Controlled I/O Example

- Machine instructions that can check the state of the status flags and transfer data:

  READWAIT   Branch to READWAIT if SIN = 0
                      Input from DATAIN to R1

  WRITEWAIT Branch to WRITEWAIT if SOUT = 0
                      Output from R1 to DATAOUT

Program-Controlled I/O Example

- Memory-Mapped I/O – some memory address values are used to refer to peripheral device buffer registers. No special instructions are needed. Also use device status registers.

```
READWAIT  Testbit   #3, INSTATUS
          Branch=0  READWAIT
          MoveByte  DATAIN, R1
```

Program-Controlled I/O Example

- Assumption – the initial state of SIN is 0 and the initial state of SOUT is 1.

- Any drawback of this mechanism in terms of efficiency?
  - Two wait loops→processor execution time is wasted

- Alternate solution?
  - Interrupt

Stacks
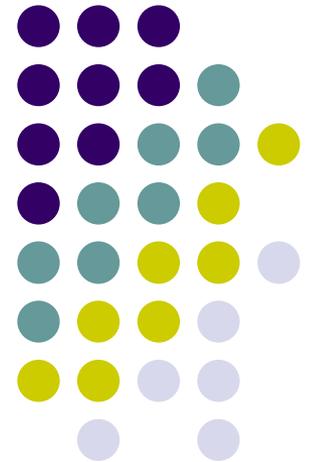

Home Work

- For each Addressing modes mentioned before, state one example for each addressing mode stating the specific benefit for using such addressing mode for such an application.

Logical Shifts

- Logical shift – shifting left (LShiftL) and shifting right (LShiftR)

← C ←	R0	← 0

before: | 0 | | 0 1 1 1 0 · · · 0 1 1 |

after: | 1 | | 1 1 0 · · · 0 1 1 0 0 |

(a) Logical shift left   LShiftL   #2,R0

0 →	R0	→ C →

before: | 0 1 1 0 · · · 0 1 1 | | 0 |

after: | 0 0 0 1 1 1 0 · · · 0 | | 1 |

(b) Logical shift r ight   LShiftR   #2,R0

Arithmetic Shifts

```
before:   1  0  0  1  1  ·  ·  ·  0  1  0        0

after:    1  1  1  0  0  1  1  ·  ·  ·  0        1
```
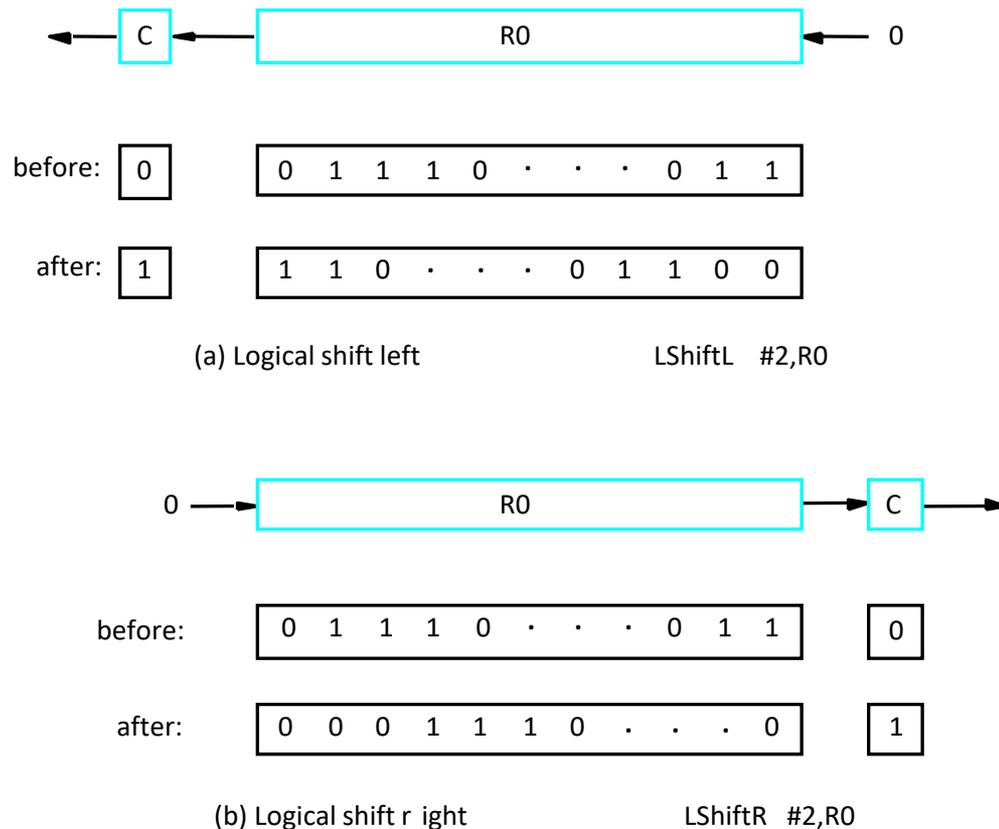

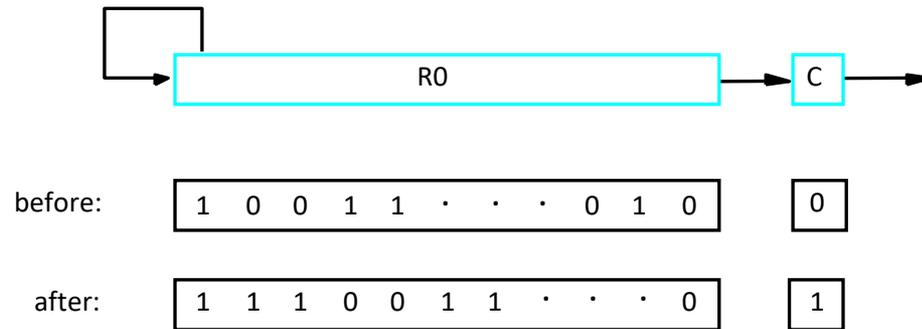

(c) Ar ithmetic shift right   AShiftR   #2,R0

Rotate

before: 0   0 1 1 1 0 · · · 0 1 1

after: 1   1 1 0 · · · 0 1 1 0 1

(a) Rotate left without carry   RotateL #2,R0

before: 0   0 1 1 1 0 · · · 0 1 1

after: 1   1 1 0 · · · 0 1 1 0 0

(b) Rotate left with carry   RotateLC #2,R0

after: 1 1 0 1 1 1 0 · · · 0   1

(c) Rotate right without carry   RotateR #2,R0

before: 0 1 1 1 0 · · · 0 1 1   0

after: 1 0 0 1 1 1 0 · · · 0   1

(d) Rotate right with carry   RotateRC #2,R0
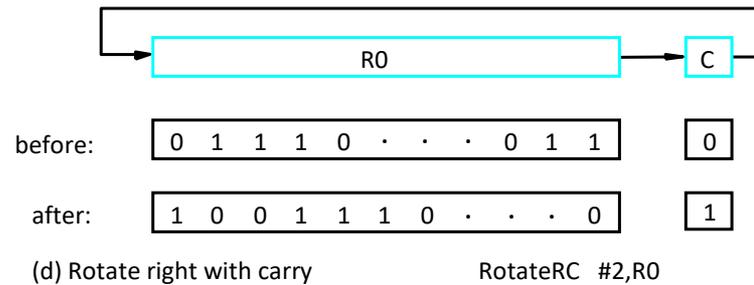

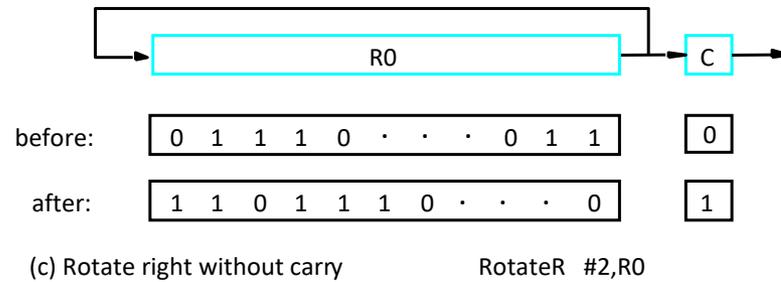

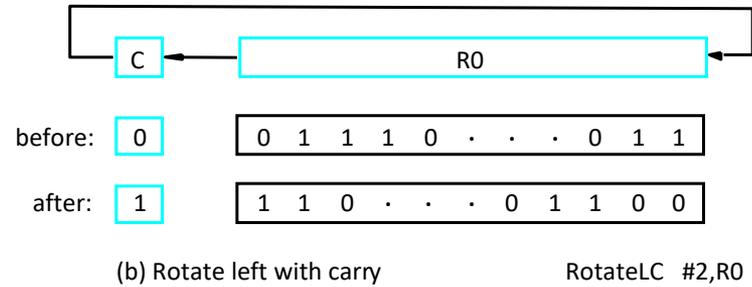

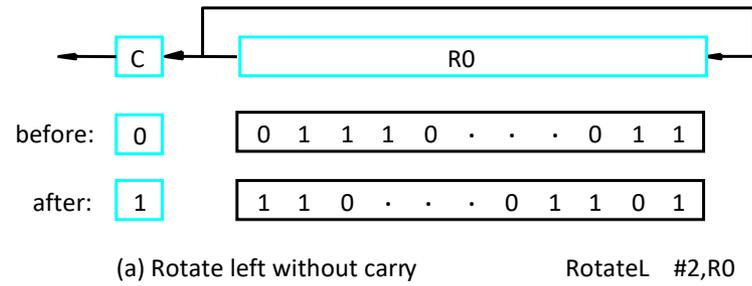

Figure 2.32. Rotate instructions.

Multiplication and Division

- Not very popular (especially division)
- Multiply R_i, R_j
  $R_j \leftarrow [R_i] \times [R_j]$
- 2n-bit product case: high-order half in R(j+1)
- Divide R_i, R_j
  $R_j \leftarrow [R_i] / [R_j]$
  Quotient is in Rj, remainder may be placed in R(j+1)

Encoding of Machine Instructions
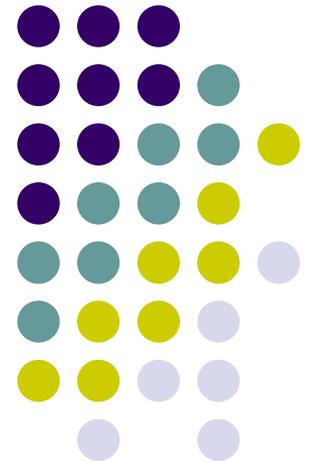

Encoding of Machine Instructions

- Assembly language program needs to be converted into machine instructions. (ADD = 0100 in ARM instruction set)
- In the previous section, an assumption was made that all instructions are one word in length.
- OP code: the type of operation to be performed and the type of operands used may be specified using an encoded binary pattern
- Suppose 32-bit word length, 8-bit OP code (how many instructions can we have?), 16 registers in total (how many bits?), 3-bit addressing mode indicator.
- Add R1, R2
- Move 24(R0), R5
- LshiftR #2, R0
- Move #$3A, R1
- Branch>0 LOOP

8	7	7	10
OP code	Source	Dest	Other info

(a) One-word instruction

Encoding of Machine Instructions

- What happens if we want to specify a memory operand using the Absolute addressing mode?
- Move R2, LOC
- 14-bit for LOC – insufficient
- Solution – use two words

OP code	Source	Dest	Other info
Memory address/Immediate operand			
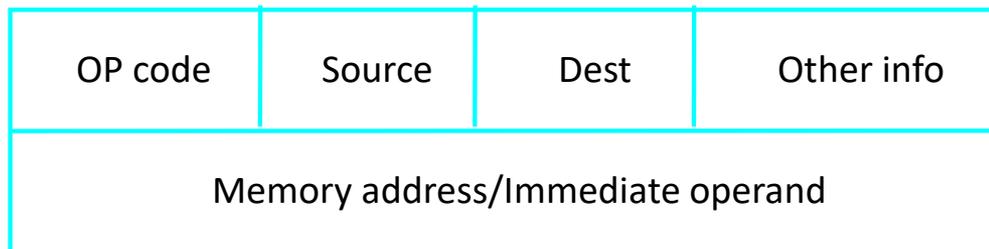

(b) Two-word instruction

Encoding of Machine Instructions

- Then what if an instruction in which two operands can be specified using the Absolute addressing mode?

- Move LOC1, LOC2

- Solution – use two additional words

- This approach results in instructions of variable length. Complex instructions can be implemented, closely resembling operations in high-level programming languages – Complex Instruction Set Computer (CISC)

Encoding of Machine Instructions

- If we insist that all instructions must fit into a single 32-bit word, it is not possible to provide a 32-bit address or a 32-bit immediate operand within the instruction.

- It is still possible to define a highly functional instruction set, which makes extensive use of the processor registers.

- Add R1, R2 ----- yes

- Add LOC, R2 ----- no

- Add (R3), R2 ----- yes
